                                                                                                                                                 뫄
                                                                                                                                                                                    Ş
                                                                                                                                                                                                                                                                                                      The present invention relates to human adipocyte complement related protein homolog, ZACRP6 protein and coding sequence (see AAB89596 and CC AAC90051). ZACRP6 has a carboxyl-terminal Clq domain. The zacrp6 gene is located on human chromosome 21q. zacrp6 gene and protein are useful for cd diagnosing and treating inflammations, for determining arterial cremodelling, for modulating calcium ion concentration, hormone secretion, DNA synthesis or cell growth, inositol phosphate turnover, arachidonate release, phospholipase C activation, gastric emptying, human centrophil activation or ADCC capability and superoxide anion production. Target gene and protein are also useful as antimicrobial applications, preferably against bacteria and virus, for complement inhibition, for treating acute vascular injury, disseminated intravascular coagulation, arteriosclerosis and for wound healing. The present sequence is human adipocyte complement related protein homolog zsig39. This protein was used in a sequence homology comparison with ZACRP6 protein.
                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention provides the protein and coding sequences of the human and murine secreted or transmembrane proteins TANGO 253, TANGO 27 TANGO 281 and INTERCEPT 258. These are useful in the treatment of coronary, pulmonary, olfactory, immunological, neurological, developmental and kidney disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; mouse; secreted protein; TANGO253; TANGO 257; TANGO 281; INTERCEPT 258; coronary disorder; olfactory disorder; neurological disorder; pulmonary disorder; immunological disorder; developmental disorder; kidney disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New nucleic acids for treating diseases and disorders, e.g. atherosclerosis, infection, autoimmune diseases, obesity, ear disorders, brain disorders, tumors, diabetes, arthritis, multiple sclerosis and asthma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              19-JUN-2000; 2000WO-US16883.

No. is the number of results predicted by chance to have score greater than or equal to the score of the result being and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  protein search, using sw model

Amplification of CDNA40592 was observed in primary lung tumours and in primary colon growth. Antagonists (e.g. antibodies) directed to PRO344 may have Last in cancer therapy. The invention identifies 14 genes (see AAX87254-67) that are amplified in the genome of tumour cells. Such amplification is expected to be associated with overexpression of the gene product and to contribute to tumorigenesis. The encoded and/or treatment (including prevention) of certain cancers, and may each as predictors of the prognosis of tumour treatment. Antibodies that bind the proteins are claimed and used in claimed cancer.

The present invention describes nucleic acids encoding PRO secreted and transmembrane proteins used therapeutically. The PRO proteins have cytostatic, anti-inflammatory, anti-proliferative and immunosuppressive activity. The proteins and polynucleotides can be used in therapy, identification of homologues, raising antibodies and design of probes and primers. They can be used in a range of diseases related to proteins that they have homology with, e.g. a PRO protein having homology to complement proteins may be used in inflammatory responses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI; 1999-371118/31.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               method of producing zsig39 polypeptide are claimed, as well as zsig39 polypeptides having N- or C-terminal affinity tags, toxins, radionucleotides, enzymes or fluorophores, fusion proteins including zsig39 polypeptides, an antibody that specifically binds to an epitope of zsig39, and a method for modulating free fatty acid metabolism by administering a zsig39 polypeptide. The zsig39 polypeptide may also be used in organ preservation, for zurgical pretreatment to prevent injury due to ischaemia and/or inflammation, and as an antimicrobial agent,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              amino acids and a cleavage site. A single EST sequence was discovered, and the novel polypeptide encoded by the full-length cDNA allowed the identification of a homologue relationship with adipocyte complement related protein Acrp30 and adipocyte secreted protein apM1. A full-length clone (see AAX24684) was obtained from tissue library. Expression vectors, cultured cells and a lung tissue library.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           methionine start site, a hydrophobic region of approximately amino acids and a cleavage site. A single EST sequence was

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 60
```

This polypeptide comprises human adipocyte-specific protein zsig39, a protein that modulates free fatty acid metabolism. zsig39 is a member of a family of proteins having a globular domain and a collagen-like domain capable of dimerisation or oilgomerisation. zsig39 polypeptides were initially identified by querying an EST database for secretory signal sequences characterised by an upstreament. upstream

esperanting the con-

Zsig39 protein - used to modulate fatty acid metabolism

Sixty four PRO polypeptides, useful in the diagnosis and treatment of immune related disorders, e.g. systemic lupus erythematosis, rheumato arthritis, osteoarthritis, thyroiditis and diabetes mellitus. rheumatoid

Fig 96; 309pp; English.

The present invention describes sixty four human PRO proteins which can be used in the treatment of immune related diseases. The human PRO proteins, anti-PRO antibodies, agonists and antagonists are useful for treating and diagnosing immune related disorders. The disorders are selected from systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, spondyloarthropathies, systemic sclerosis, idiopathic inflammatory myopathies, Sjogren's systemic systemic vasculitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune thrombocytopaenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases of the central and peripheral nervous systems, hepatobiliary diseases, inflammatory disease, gluten-sensitive enteropathy and whipple's disease, mmune or immune-mediated skin diseases, allergic diseases,

AAC58397 to AAC58578 represent PCR primers and hybridisation probes in the isolation of human PRO sequences. AAC58599 to AAC58642 and AAB33414 to AAB33477 represent human PRO polynucleotide and protein sequences given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                14; DNA40592-1242; human; ATCC No: 209492; antiproliferative; lastic cell growth inhibitor; cytostatic; treatment; cancer; tumour; st; prostate; colon; lung; renal; ovarian; central nervous system; leukemia; melanoma; Expressed Sequence Tag; EST; secreted protein;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    241

It is isolated from human foetal lung tissue, cDNA library, identified using probes based on a consensus sequence DNA34398, derived from secreted protein extracellular domain NC (ECD) expressed sequence tag (EST). This clone is assigned ATCC deposit NC: 209492. PRO344 functions as a neoplastic cell growth inhibitor and is used for treating tumours, using an effective amount of PRO555, PRO364 and PRO344. This composition is especially useful for treatment of human cancers such as breast, prostate, colon, lung, renal, ovarian and CNS, leukemia and melanoma.
                                                                                                                                                                                                                                                                                                                                                                                              Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 16-DEC-1998;

The present sequence represents a novel human polypeptide. The specification describes novel polypeptides designated PRO201, PRO292, PRO327, PRO1265, PRO344, PRO347, PRO357, PRO715, PRO1017, PRO1112, PRO509, PRO853 and PRO882. These genes are amplified in the genome of tumour cells. The polypeptides are believed to contribute to tumourigenesis. The polypeptides are useful target for the identification of certain cancers, and may act as predictors of the prognosis of tumour treatment. Antibodies against these polypeptides are useful in the treatment and diagnosis of neoplastic cell growth and cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 61; Fig 10; 220pp;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                5
                                                                New human nucleic acids encoding secreted and transmembrane polypeptides which are designated as PRO polypeptides are described. The membrane-bound proteins have various industrial applications, including as pharmaceutical and diagnostic agents. The membrane-bound proteins can also be employed for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interaction. Anti-PRO antibodies are useful for the affinity purification of PRO from recombinant cell culture or natural sources.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC PRO polypeptides, to link bioactive molecules to cells expressing PRO polypeptides, to modulate biological activities of cells expressing CC PRO polypeptides, and to detect the presence of mammalian lung, colon, CC breast, prostate, rectal, cervical or liver tumours by comparing PRO CC Some of the 275 sequences are also useful to stimulate the release of proliferation or differentiation of chodrocytes, the proliferation or certilage, the proliferation of inner ear utricular supporting cells or T. lymphocytes, the release of a cytokine from peripheral blood CC monocytes, the proliferation of inner ear utricular supporting cells or CC monocytes, the proliferation of a cells or by adipocytes; or inhibit binding of A-peptide to factor VIIA. The PRO polypeptides can be used in assays to identify CC molecules involved in binding interactions. The polypucleotides encoding transgenic or knock out animals and can be used in gene therapy.

The present invention relates to human adipocyte complement related protein homolog, zacrp5 protein and coding sequence (see AAB49590 and AAC90045). ZACRP5 has a carboxyl-terminal Clq domain. The zacrp5 gene is Cloated on human chromosome 16 zacrp5 gene and protein are useful for creation, but the constant of carboxyl-terminal Clq domain. The zacrp5 gene is Claimosing and treating inflammations, for determining arterial cremodelling, for modulating calcium ion concentration, hormone cremodelling, for calcium ion concentration, pastric emptying, human carbitonate release, phospholipase c activation, gastric emptying, human carried generally against bacteria and virus, for complement inhibition, for creating acute vascular injury, and for wound healing. The present creating acute vascular injury, and for wound healing. The present sprotein. This protein was used in a sequence homology alignment with
                                                                                                                                                                                                                                                                                                               Matches
                                                                                                                                                                                                                                                                                                                                         Query Match
